ABSTRACT

This annual report summarizes some of the notable recent trends in household and family characteristics and contains detailed demographic data from the March, 1985 "Current Population Survey." The households vary greatly in size and complexity. Some of the aspects of household demography that have important consequences for both consumer demand and public policy are changes in the number and average size of households; the proportion of households which are composed of families; whether families are maintained by married couples; and whether children are present and residing with one or both parents. Additionally, the number of married couple families has increased by 3 percent since 1980, versus an 18 percent increase for other types of families. Household size dropped from 2.76 persons in 1980 to an average of 2.69 persons in 1985. The decline in household size was less during the five years since 1980 than during either of the five-year periods between 1975-80 and 1970-75. The number of households maintained by young adults under 25 years old has declined by 17 percent since 1980. In 1985, about 60 percent of the black family groups that included children under 18 years old had only one parent present, compared with 21 percent for corresponding white family groups. Over 20 tables with detailed census data support the findings. An appendix is included which contains definitions and explanations of the terms and sources used in the report. (APG)

Household and Family Characteristics: March 1985

INTRODUCTION AND HIGHLIGHTS

This annual report summarizes some of the notable recent trends in household and family characteristics and contains detailed demographic data from the March 1985 Current Population Survey. An advance report of the 1985 data was issued in October 1985 (Current Population Reports, Series P-20, No. 402).

Households vary greatly in size and complexity. Some of the aspects of household demography that have important, if sometimes unrecognized, consequences for both consumer demand and public policy include changes in the number and average size of households, the proportion of households which are composed of families, whether those families are maintained by married couples, and whether children are present and residing with one or both parents.

Highlights of the topics presented in this year's report include:

- The number of married-couple families has increased by 3 percent since 1980, versus an 18-percent increase for other types of families.
- Household size dropped from 2.76 persons in 1980 to an average of 2.69 persons in 1985. The decline in household size was less during the 5 years since 1980 than during either the 5-year period between 1975-80 or 1970-75.
- The number of households maintained by young adults under 25 years old has declined by 17 percent since 1980.
- In 1985, about 60 percent of the Black family groups that included children under 18 years old had only one parent present, compared with 21 percent for corresponding White family groups.

The data in this report are estimates based on sample surveys and are thereby subject to sampling variability since they are not based on a complete enumeration of the population. Caution is advised when comparing differences in estimates that are based on a small number of cases, especially if the difference between the two estimates being compared is not large. See Appendix B, "Source and Reliability of Estimates," for a complete discussion of sampling variability, and how it affects the data.

HOUSEHOLD COMPOSITION

There were approximately 86.8 million households in the United States in March 1985 according to the results of the Current Population Survey (CPS). The number of households has increased by only 7 percent since 1980, compared with a 14-percent increase for the 1975-80 period. Detailed information about the composition of these households is collected by the Census Bureau each March as part of the Annual Demographic Supplement to the CPS. Changes in the type and size of households from one period of time to another are important indicators of shifts in underlying demographic factors, and in the social forces and economic pressures that influence the survival prospects of certain households and, thereby, household composition in general (figure 1).

The Census Bureau identifies two major categories of households: family and nonfamily. Various subcategories of households exist within the family/nonfamily dichotomy depending on the presence or absence of a spouse and children, whether the person lives alone, the sex of the householder, and various other characteristics.

Family households. A family household requires the presence of at least two persons: the householder (the person, or one of the persons, who owns or rents the living quarters) and one or more additional persons who are relatives of the householder through birth, marriage, or adoption. There were an estimated 62.7 million family households in 1985 (table A), of which about 50.4 million were married-couple families, 10.1 million were families with female householders (no husband present), and 2.2 million were families with male householders (no wife present).

There is some evidence of a decline since 1980 in the rate of increase in the number of married-couple families. The number of married-couple families increased by 3 percent between 1980 and 1985, compared with increases of approximately 5 percent for both the 1975-80 and 1970-75 periods. The rate of increase for families with female householders (no husband present), has been much greater than that for married-couple families in each of the 5-year periods since 1970. The increase in families maintained by women alone, however, slowed to 16 percent for 1980-85, which was not down significantly from 22 percent for 1975-80, but was substantially below the increase of 30 percent between 1970 and 1975. Families maintained by men (no wife present) also increased at a much greater rate than married-couple families during each 5-year period over the past 15 years. In fact, since 1980, families maintained by men alone increased at a greater rate than either married-couple families or families maintained by women alone. Even so, lone men maintained fewer than 4 out of every 100 families in 1985.

In sum, the relatively small rate of increase for married-couple families, compared with other types of families, has significantly altered the composition of families since 1970.

For example, families maintained by persons whose spouse is absent increased from 13 percent of family households in 1970 to 20 percent in 1985.

Nonfamily households. A nonfamily household is composed of a householder who lives alone, or with one or more nonrelatives. A few nonfamily households contain subgroups

Other family, female householder	10,129	8,705	7,127	5,500	16.4	22.1	29.6
No own children under 18	4,123	3,261	2,826	2,642	26.4	15.4	7.0
With own children under 18	6,006	5,445	4,301	2,858	10.3	26.6	50.5
Nonfamily householder	24,082	21,226	15,557	11,945	13.5	36.4	30.2
Male householder	10,114	8,807	5,912	4,063	14.8	49.0	45.5
Living alone	7,922	6,966	4,918	3,532	13.7	41.6	39.2
Female householder	13,968	12,419	9,645	7,882	12.5	28.8	22.4
Living alone	12,680	11,330	9,021	7,319	11.9	25.6	23.3

of persons who are related to each other but not to the householder (i.e., unrelated subfamilies).

There were 24.1 million nonfamily households in 1985. The number of nonfamily households has increased much more slowly since 1980 than during the 1970's. Nonfamily households increased by only 13 percent during 1980-85, compared with 36 percent during 1975-80 and 30 percent during 1970-75.

The proportion of nonfamily householders who lived alone was about 78 percent among males in 1985 and 91 percent among females. The rate of increase since 1980 in the number of males living alone has been only about one-third as large as it was during the late 1970's (14 percent as compared with 42 percent). The rate of increase in the number of women living alone has been 12 percent since 1980, substantially less than the 26-percent increase that occurred during the 1975-80 period.

The increase in the number of persons living alone was one of the major changes in household demographics during the 1970's. During the 1980's the number of persons living alone has continued to increase, but at a significantly diminished rate.

DROP IN AVERAGE HOUSEHOLD SIZE

Changes in household composition have resulted in households which, on average, include fewer people than in the past. The average number of persons per household reached a new low of 2.69 in 1985, versus 2.76 in 1980, 2.94 in 1975, and 3.14 in 1970. As can be seen in table B, the vast majority of the decline in household size is accounted for by a drop in the average number of persons under 18 years of age.

Although the number of households has increased by 7 percent since 1980, the number of persons in households has risen by just 5 percent. During the 1970's, the difference was much larger. The increase was 14 percent for households versus 7 percent for the household population during 1975-80, and 12 percent versus 5 percent, respectively, during 1970-75. The discrepancy in the increase in the number of household units as compared with the increase in the household population living in those units is reflected in the change in the proportion of households of the smallest possible size (i.e. one person), which rose from 17 percent of the total in 1970 to 24 percent in 1985. Conversely, the proportion of large households containing five persons or more fell from 21 percent to 11 percent of the total during the same 15-year period.

Changes in the availability of affordable housing, or in other economic conditions that might encourage young or elderly unattached persons, as well as families, to "double up" with friends or relatives could result in a reversal of the decline in average household size. However, as long as there is not a significant increase in the fertility rate, and people are able to realize their preferences for small families and independent living arrangements, average household size is likely to remain relatively low. Recent projections suggest that average household size will continue to decline through the end of this century but the decline is not likely to be as large as it was between 1970 and 1985.[1]

AGE OF HOUSEHOLDERS AND HOUSEHOLD INCREASE

The number of households maintained by young adults under 25 has declined by 17 percent since 1980, reversing

increases of 13 percent between 1975 and 1980 and 34 percent between 1970 and 1975 (table C). The rate of increase for householders 25 to 29 and 30 to 34 years old has also tapered off significantly since 1980. To a large extent, these shifts reflect changes in the underlying age structure of the population. Members of the large postwar baby boom generation were in their late twenties and early thirties during the 1970's, and they were forming a significant number of households. This generation is moving toward middle age, and is being replaced in the prime household forming ages by the numerically smaller generation that followed. The effect of this change in the age structure of the population has been accentuated by the fact that a smaller proportion of today's young adults are forming households than in the past.[2] The changes in household formation patterns since 1980 which are associated with a declining propensity for young adults to form households may reflect, to some extent, changes in either economic circumstances or societal expectations.

SELECTED CHARACTERISTICS OF HOUSEHOLDS

Region. Households are distributed unevenly across the four Census regions, and the proportion of certain types of households which are in a particular region differs slightly from the proportion of all households which are in the region. For example, the Northeast contained 21 percent of the Nation's households in 1985, but it contained 24 percent of the family households maintained by women alone (table D). Similarly, 20 percent of all households were in the West, but that region had about 24 percent of the nonfamily households maintained by men.

Race and origin of householder. Approximately 87 percent of all householders in 1985 were White, but Whites accounted for only 69 percent of the female householders whose husbands were absent. In contrast, only 11 percent of householders were Black, but Blacks constituted 29 percent of the female householders maintaining families alone. Persons of Spanish origin constituted 6 percent of all householders, and 9 percent of the males maintaining families with no wife present.

Median age of householder. By Census definition a householder must be at least 15 years of age. For 1985, the median age of persons maintaining households was 45.4 years. Persons maintaining family households had a median age of 44.2 years, about 8.8 years younger than persons maintaining nonfamily households. The differential in age is due mainly to the fact that a relatively large proportion of family householders are persons of childbearing age, many with children in the home, whereas, a relatively large proportion of nonfamily householders are elderly women whose spouses are no longer living. The median age of female nonfamily householders was almost 63.5 years.

Marital status of householder. About 50 million households in 1985, or 58 percent of the total, were maintained by persons who were currently married and living with their spouses. These data refer to marital status at the time of the survey, and do not indicate, for example, how many married householders have ever been divorced or widowed prior to remarriage.

A high proportion of householders maintaining families in the absence of their spouses were currently divorced: 35 percent of the men and 38 percent of the women. (There is some evidence that the difference in these two proportions is statistically significant.) Among nonfamily householders about half of the men had never been married, and about the same proportion of female nonfamily householders were widowed.

Average size. The decline in average household size began in the mid-1960's, was interrupted in 1983, but has since

[1]Persons of Spanish origin may be of any race.

resumed.[3] There was an average of 2.69 persons per household in 1985. The average household size was 3.30 persons for married-couple families, compared with 3.14 for families maintained by a woman where the husband was absent. Among nonfamily households, those maintained by women averaged only 1.12 persons (about 91 percent of such women lived alone).

Presence of children. Most households did not include a householder's child under 18 years old in 1985, and (perhaps surprisingly) barely half of family households included at least one child of the householder. The Census Bureau's definition of a family household requires the presence of at least one relative of the householder, but this relative need not be a child. Families which have reared children who are all now adults or with homes of their own will be classified as families with "no children," because the offspring are older than age 17, living elsewhere, or both. Families maintained by women alone were more likely to include children under 18 than married-couple families (59 percent versus 48 percent). The proportion of families maintained by men alone which included children was only 40 percent.

Nonfamily households do not include children related to the householder. A few nonfamily households, however, do include children who are not related to the householder. An example of this is a three-person household consisting of a mother and her child residing with an unrelated householder.

Nonrelatives in household. Comparatively few households contain members who are nonrelatives of the householder. In 1985, nonrelatives were present in only about 5.0 million households. In the vast majority of cases where nonrelatives were present, there was only one such person in the household. Housemates, unmarried partners, paid employees, and other persons not related to the householder are among those considered to be nonrelatives. An unmarried couple, for example, would constitute a household containing a nonrelative. Family households were, understandably, much less likely than nonfamily households to include nonrelatives: 2 percent versus 14 percent. Only about 1 percent of married-couple households included a nonrelative, although the proportion was much higher (15 percent) among family households maintained by a man with no wife present. Among nonfamily households, nonrelatives were much more likely to be present in those maintained by men than women (22 percent versus 9 percent).

Tenure. Tenure status depends upon whether a housing unit is occupied by owners or by renters. Householders are considered owners if they own their living quarters outright or through a mortgage. Householders not classified as owners are considered renters whether or not they actually pay rent. About 64 percent of householders were owners in 1985. Among family householders the proportion who were owners was 78 percent for married couples, versus only 47 percent for women whose husbands were absent and 56 percent for men whose wives were absent. Fewer than half of nonfamily householders were owners.

RACIAL DIFFERENTIALS IN FAMILY COMPOSITION

The overall family composition of Blacks is different from that of Whites. Family composition has changed significantly for both races, however, during the past 15 years (figure 2). In 1970, married couples accounted for 68 percent of Black family households, another 28 percent were maintained by women with no husbands present, and the remaining 4 percent were maintained by men with no wife present (table E). Among White families in 1970, about 89 percent were married couples, 9 percent were maintained by women alone, and 2 percent were maintained by men alone.

One of the most notable changes since 1970 in the composition of family households has been the dramatic increase in families maintained by women. The proportion of all Black families that were maintained by women, with no husbands present, increased from 28 percent in 1970 to 35 percent in 1975, 40 percent in 1980, and 44 percent in 1985. The corresponding proportion among Whites increased from 9 percent in 1970, to 10 percent in 1975, 12 percent in 1980, and 13 percent in 1985. Families maintained by women do not neccessarily include children, although most of them do (59 percent).

Whereas the number and proportion of women maintaining families alone has continued to increase since 1970, there has been a deceleration in the rate of increase in female householders. The rate has slowed among both Blacks and Whites, but the drop in the rate among Blacks has been greater. The number of Black women maintaining families increased 41 percent during the first half of the 1970's, versus just 19 percent since 1980. By contrast, the number of White women maintaining families increased by 25 percent during the 1970-75 period, compared with 15 percent for the 1980-85 period. The difference since 1980 in the rate of increase between Blacks and Whites is not considered statistically significant.

The rise in families maintained by women alone is accounted for by a corresponding decline in the proportion of married-couple families among both Blacks and Whites. Between 1970 and 1985, the proportion of Black families maintained by married couples fell from 68 percent to 51 percent. Among Whites, married couples constituted 84 percent of families in 1985, down from 89 percent in 1970.

ONE-PARENT FAMILY GROUPS

Family groups consist of three distinct components: family households, related subfamilies, and unrelated subfamilies. Family households own or rent the housing unit in which they reside, whereas related subfamilies live in a relative's

[3] U.S. Bureau of the Census, Current Population Reports, Series P20, No. 402.

household, and unrelated subfamilies live in households maintained by persons to whom they are not related. For example, a mother and her young child would be considered a family household if they maintained their own home; a related subfamily if they resided with the mother's parents; or an unrelated subfamily if they resided with the mother's unrelated friend. A household may contain no family group, only one family group, or it may include more than one such group. The

all-inclusive family group concept is particularly useful when considering one-parent situations since a very high proportion of related and unrelated subfamilies are single parents and their children.

One of the most significant changes in family composition over the past 15 years has been the substantial growth in the number of one-parent situations. Single parents accounted for 26 percent of all family groups with children under 18 years old in 1985, a proportion twice as large as in 1970 (table F). There was a substantial increase (49 percent) in the number of one-parent groups between 1970 and 1975, but the rate of increase fell to 22 percent between 1975 and 1980, and has remained near that level over the 5-year period since 1980.

Although Whites maintain about two-thirds of one-parent groups overall, single parents are much more prevalent among Blacks than Whites (figure 3). In 1985, about 60 percent of the Black family groups with children were maintained by only one parent, versus 21 percent for Whites, a differential of about 39 percentage points between the races. The corresponding proportions in 1970 were 36 percent among Blacks, compared with 10 percent for Whites—a difference of 26 points. Thus, the gap between the races in the incidence of single-parent situations has grown larger since 1970.

Among Whites the rate of increase in single parents dropped from 44 percent for the 1970-75 period, to 23 percent for the 1975-80 period, and then remained at about 23 percent for the 1980-85 period. Black single parents increased 56 percent between 1970 and 1975, tapered off to just an 18-percent rise for the 1975-80 period, and increased 33 percent over the period since 1980.[4]

Almost all one-parent family groups are created by premarital births, separation, divorce, or widowhood. Women who have never been married or who are divorced accounted for 62 percent of the one-parent situations in 1985 (table G).

The proportion of single parents who are mothers who have never been married has increased dramatically from about 7 percent in 1970 to 25 percent in 1985. Some of this change is due to refinements in the processing of the survey that permitted more complete identification of never-married and other persons maintaining subfamilies. These technical changes were introduced in the 1982 and 1983 data (for additional detail see Current Population Reports, P-20, Nos. 398 and 399). However, the increase in these never-married mothers reflects not only improved survey measurements, but also recent birth rates for unmarried women which have increased among Whites while remaining at extremely high, though slightly declining, levels among Blacks.[5]

In 1985, the proportion of one-parent groups maintained by never-married women among Blacks was 49 percent compared with 15 percent in 1970. The rate of increase in the

[4]During the 1970's, the difference in the rates of increase between Blacks and Whites is not considered statistically significant, but there is some evidence of a difference since 1980. For Blacks, there is some evidence of a statistically significant difference the 1975-80 and 1980-85 rates of increase.

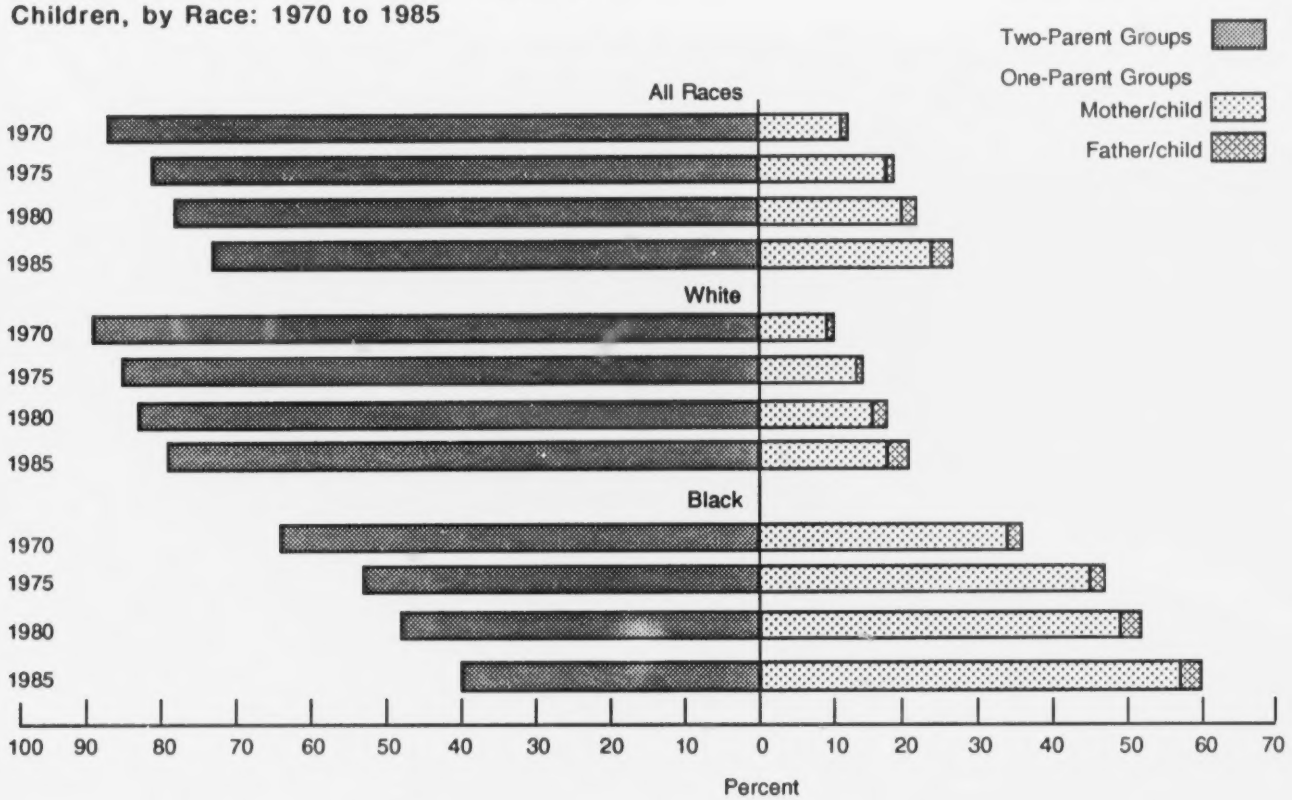
FIGURE 3.

Change in Composition of Family Groups with Children, by Race: 1970 to 1985



number of these never-married Black mothers was much lower from 1975 to 1980 than during the early 1970's. The rate has accelerated since 1980, but again, this is partially attributable to methodological changes in the processing of survey results.

Divorced mothers constituted about 37 percent of the persons maintaining one-parent groups, significantly higher than their 29-percent share in 1970. The rate of increase in the number of these divorced mothers, however, was smaller for the 1975-80 period than for the 1970-75 period, and has slowed still further since 1980. This trend may reflect, in part, the stablization and slight drop in divorce rates reported by the National Center for Health Statistics.[6]

Among Whites, divorced mothers accounted for 45 percent of the single parents in 1985. The corresponding proportion was 20 percent among Blacks, where the single parent is much more likely to have never been married than divorced.

Fathers maintained about 12 percent of the one-parent groups in 1985. These father-child situations represented a considerably larger proportion of all one-parent groups among Whites (15 percent) than Blacks (6 percent). The number of White single-parent fathers has gone up by 56 percent since 1980, versus a 22 percent increase for 1975 to 1980. Thus, there is some evidence of an acceleration in the rate of increase for this type of family group among Whites.

RELATED REPORTS

Data on households and families for 1985 and earlier years were published in Current Population Reports, Series P-20, No. 402, *Households, Families, Marital Status, and Living Arrangements: March 1985 (Advance Report).* Additional detailed statistics on marital status, age at first marriage, divorce ratios, unmarried couples, and the living arrangements of children and young adults, are among the data presented in Current Population Reports, Series P-20, No. 410, *Marital Status and Living Arrangements: March 1985,* a companion to this report in which persons, rather than households, are the primary unit of analysis. State household estimates were published in Current Population Reports, Series P-25, No. 974, *Estimates of Households, for States: 1981 to 1984.* Household projections are available in Current Population Reports, Series P-25, No. 986, *Projections of the Number of Households and Families: 1986 to 2000.*

Additional data on households, families, and marital status have been published by the Bureau of the Census in Current Population Reports, Series P-20, P-23, and P-25. See the complete listing at the end of this publication.

Appendix A. Definitions and Explanations

Coverage. The population in this report includes the civilian noninstitutional population of the United States plus approximately 925,000 members of the Armed Forces in the United States living off post or with their families on post in 1985 but excludes all other members of the Armed Forces.

Symbols. A dash (-) represents zero or rounds to zero. The symbol "B" means that the base for the derived figure is less than 75,000. An "X" means not applicable, and "NA" means not available.

Rounding of estimates. Individual figures are rounded to the nearest thousand without being adjusted to group totals, which are independently rounded; percentages are based on the unrounded numbers.

Age. The age classification is based on the age of the person at the person's last birthday. The adult universe (i.e., population of marriageable age) is now comprised of persons 15 years old and over. Prior to 1980 the adult universe was 14 years old and over.

Race. The population is divided into three groups on the basis of race: White, Black, and "other races." The last category includes Indians, Japanese, Chinese, and any other race except White and Black.

Persons of Spanish origin. Persons of Spanish origin in this report were determined on the basis of a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (or the origin of some other household member) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin. Persons of Spanish origin may be of any race.

Marital status. The marital status classification identifies four major categories: single (never married), married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is further divided into "married, spouse present," "separated," and "other married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he or she may have been temporarily absent on business or on vacation, visiting, in a hospital, etc., at the time of the enumeration. Persons reported as separated included those with legal separations, those living apart with intentions of obtaining a divorce, and other persons permanently or temporarily separated because of marital discord. The group "other married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, had moved to another area, or had a different place of residence for any other reason except separation as defined above.

Husband in Armed Forces. When a woman was reported as married but her husband was not enumerated as a member of the same household, an additional question was asked to determine whether her husband was in the Armed Forces. Women who were reported as separated were not asked the additional question.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other group of rooms, or a single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is direct access from the outside or through a common hall.

A household includes the related family members and all the unrelated persons, if any, such as lodgers, foster children, wards, or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes group quarters.

Group quarters. As of 1983 group quarters were defined in the Current Population Survey as noninstitutional living arrangements for groups not living in conventional housing units or groups living in housing units containing nine or more persons (or prior to 1983 five or more persons) unrelated to the person in charge. Since 1972, inmates of institutions have not been included in the Current Population Survey.

Householder. The householder refers to the person (or one of the persons) in whose name the housing unit is owned or rented (maintained) or, if there is no such person, any adult member, excluding roomers, boarders, or paid employees. If the house is owned or rented jointly by a married couple, the householder may be either the husband or the wife. The person designated as the householder is the "reference person" to whom the relationship of all other household members, if any, is recorded.

Prior to 1980, the husband was always considered the householder in married couple households. The number of householders is equal to the number of households. Also, the number of family householders is equal to the number of families.

Head versus householder. Beginning with the 1980 CPS, the Bureau of the Census discontinued the use of the terms "head of household" and "head of family." Instead, the terms "householder" and "family householder" are used. Recent social changes have resulted in greater sharing of household responsibilities among the adult members and, therefore, have made the term "head" increasingly inappropriate in the analysis of household and family data. Specifically, the Census Bureau has discontinued its longtime practice of always classifying the husband as the reference person (head) when he and his wife are living together.

In this report, the term "householder" is used in the presentation of data that had previously been presented with the designation "head." The householder is the first adult household member listed on the questionnaire. The instructions call for listing first the person (or one of the persons) in whose name the home is owned or rented. If a home is owned jointly by a married couple, either the husband or the wife may be listed first, thereby becoming the reference person, or householder, to whom the relationship of other household members is to be recorded.

Family. A family is a group of two persons or more (one of whom is the householder) related by birth, marriage, or adoption and residing together; all such persons (including related subfamily members) are considered as members of one family. Beginning with the 1980 CPS, unrelated subfamilies (referred to in the past as secondary families) are no longer included in the count of families, nor are the members of unrelated subfamilies included in the count of family members.

Family household. A family household is a household maintained by a family (as defined above), and any unrelated persons (unrelated subfamily members and/or secondary individuals) who may be residing there are included. The number of family households is equal to the number of families. The count of family household members differs from the count of family members, however, in that the family household members include all persons living in the household, whereas family members include only the householder and his/her relatives. (See the definition of family.)

Related subfamily. A related subfamily is a married couple with or without children, or one parent with one or more own single (never married) children under 18 years old, living in a household and related to, but not including, the person or couple who maintains the household. The number of related subfamilies is not included in the count of families.

Unrelated subfamily. An unrelated subfamily (formerly called a secondary family) is a group of two persons or more who are related to each other by birth, marriage, or adoption, but who are not related to the householder. The unrelated subfamily may include persons such as guests, roomers, boarders, or resident employees and their relatives living in a household. The number of unrelated subfamily members is included in the number of household members but is not included in the count of family members.

Persons living with relatives in group quarters were formerly considered as members of unrelated subfamilies. However, the number of such unrelated subfamilies became so small (37,000 in 1967) that beginning with data for 1968 (and beginning with census data for 1960) the Bureau of the Census includes persons in these unrelated subfamilies in the count of secondary individuals.

Family group. A family group is any two or more persons (not necessarily including a householder) residing together, and related by birth, marriage, or adoption. A household may be comprised of one such group, more than one, or none at all. The count of family groups includes family households, related subfamilies, and unrelated subfamilies.

Married couple. A married couple, as defined for census purposes, is a husband and wife enumerated as members of the same household. The married couple may or may not have children living with them. The expression "husband-wife" or "married-couple" before the term "household," "family," or "subfamily" indicates that the household, family, or subfamily is maintained by a husband and wife. The number of married couples equals the count of married-couple families plus related and unrelated married-couple subfamilies.

Unrelated individuals. Unrelated individuals are persons of any age (other than inmates of institutions) who are not living with any relatives. An unrelated individual may be (1) a person living alone or with nonrelatives only, (2) a roomer, boarder, or resident employee with no relatives in the household, or (3) a group quarters member who has no relatives living with him/her. Thus, a widow who occupies her house alone or with one or more other persons not related to her, a roomer not related to anyone else in the housing unit, a maid living as a member of her employer's household with no relatives in the household, and a resident staff member in a hospital living apart from any relatives are all examples of unrelated individuals.

Nonfamily householder. A nonfamily householder (formerly called a primary individual) is a person maintaining a household while living alone or with nonrelatives only.

Secondary individual. A secondary individual is a person in a household or group quarters such as guest, roomer, boarder, or resident employee (excluding nonfamily householders and inmates of institutions) who is not related to any other person in the household or group quarters. (See section on unrelated subfamily for slight change in coverage of secondary individuals in 1968.)

Size of household, family, or subfamily. The term "size of household" includes all persons occupying a housing unit. "Size of family" includes the family householder and all other persons in the living quarters who are related to the householder by birth, marriage, or adoption. "Size of related subfamily" includes the husband and wife or the lone parent and their never-married sons and daughters under 18 years of age. "Size of unrelated subfamily" includes the reference person and all other members related to the reference person. If a family has a related subfamily among its members, the size of the family includes the members of the related subfamily.

Related persons and family members. In the classification of households by number of related persons, the person or couple who maintains the household (housing unit) and all persons in the household related to them are included. In the classification of families by number of family members, all persons in the family are included. The number of family members is the same as the size of the family.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the householder. Similarly, "own" children in a subfamily are sons and daughters of the married couple or parent in the subfamily. (All children shown as members of related subfamilies are own children of the person(s) maintaining the subfamily.) "Related" children in a family include own children and all other children in the household who are related to the householder by birth, marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 25" and "own children of any age," as the terms are used here, include all children regardless of marital status. The totals include never-married children living away from home in college dormitories.

The count of related children in families was formerly restricted to single (never married) children. However, beginning with data for 1968 the Bureau of the Census includes ever-married children under the category of related children. This change added approximately 20,000 children to the category of related children in March 1968.

Tenure. A housing unit is "owner occupied" if the owner or co-owner lives in the unit, even if it is mortgaged or not fully paid for. A cooperative or condominium unit is "owner occupied" only if the owner or co-owner lives in it. All other occupied units are classified as "renter occupied," including units rented for cash rent and those occupied without payment of cash rent.

Units in structure. In the determination of the number of units in a structure, all housing units, both occupied and vacant, were counted. The statistics are presented in terms of the number of occupied housing units in structures of specified size, not in terms of the number of residential structures.

Years of school completed. In this report, data on years of school completed were derived from the combination of answers to two questions, (a) "What is the highest grade of school that the person has attended?" and (b) "Did the person finish this grade?"

The questions on educational attainment applied only to progress in "regular" schools. Such schools include public, private, and parochial schools (elementary, junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, "regular" schooling is that which advances a person toward an elementary or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force and employment status. The definitions of labor force and employment status in this report relate to the population 15 years old and over.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, bad weather, vacation, or labor management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were available for work and (1) had engaged in any specific job-seeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians classified as employed or unemployed.

Not in the labor force. All civilians who are not classified as employed or unemployed are defined as "not in the labor force." This group who are neither employed nor seeking work

includes persons engaged only in own home housework, attending school, or unable to work because of long-term physical or mental illness; persons who are retired or too old to work, seasonal workers for whom the survey week fell in an off season, and the voluntary idle. Persons doing only unpaid family work (less than 15 hours) are also classified as not in the labor force.

Occupation. The data on occupation of employed persons refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week.

In 1980, the Bureau of the Census revised the Standard Occupational Classification System (SOC) for use in its tabulation program for the 1980 census and subsequent published reports on occupational data. Consequently, the new classification system was incorporated into the CPS tabulation program in January 1983. While the new system provides comparability between the CPS and other data sources, it causes a break in continuity for all CPS series containing occupational data.

Differences between the 1970 and 1980 occupational systems affect classifications at all levels. Such commonly used identifiers as white-collar, blue-collar, professional and technical, craft workers, and operative occupations have been eliminated. These identifiers have been replaced with new categories which represent conceptual as well as language changes. Moreover, many of the components of the former groupings have been shifted to such an extent that they cannot be made to correspond readily to the new categories. For a more complete explanation and description of the changes from the old to new occupational classification system see the February 1983 issue of "Employment and Earnings" by the Bureau of Labor Statistics.

Metropolitan-nonmetropolitan residence. Data for metropolitan and nonmetropolitan areas have been omitted from this report. The Current Population Survey was undergoing a major redesign when the data for this report were collected. The purposes of this redesign were to update the sampling frame to the 1980-census base, to improve survey efficiency, and to improve the quality of the survey estimates.

The introduction of the new sample design has temporarily prevented the development of estimates for metropolitan and nonmetropolitan areas. Publication of data by residence categories is expected to resume with next year's report.

Income. Data on income cover money income only, prior to deduction for taxes, received from such sources as wages or salaries, net income from self-employment, Social Security, dividends, interest, public assistance and welfare, unemployment compensation, government pensions, and veterans payments. Certain money receipts such as capital gains are not included. For a more detailed explanation, see Bureau of the Census, Current Population Reports, Series P-60 No. 151.

Appendix B. Source and Reliability of Estimates

SOURCE OF DATA

The estimates in this report are based on data obtained in March of 1970, 1975, 1980, and 1985 from the Current Population Survey (CPS) conducted by the Bureau of the Census and from supplementary questions to the CPS. The monthly CPS deals mainly with labor force data for the civilian noninstitutional population. Questions relating to labor force participation are asked about each member in every sample household. In addition, in March, supplementary questions are asked about household and family characteristics. To obtain more reliable data for the Spanish origin population, the March CPS sample was enlarged to include all households from the previous November sample which contained at least one sample person of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are also included.

CPS design phase-in. Since the inception of the CPS in 1940, the sample has been redesigned several times to raise the quality and reliability of the data and to meet changing data needs. Beginning in April 1984, the old design was phased out through a series of changes that were completed in July 1985. The March 1985 CPS sample consists of three rotation groups from the 1970 census files, four rotation groups from the 1980 census files, and one rotation group from both files. The coverage was in all 50 States and the District of Columbia. The sample is continually updated to reflect new construction. Due to the phase-in of the new design, the March 1985 CPS sample had three rotation groups located in 629 sample areas comprising 1,148 counties, independent cities, and minor civil divisions and five rotation groups located in 729 sample areas representing 1,973 counties and equivalent geographic areas in the United States. This current number of sample areas is not completely comparable to the old number of sample areas since many of the sample areas have been redefined. In this sample, approximately 60,500 occupied households were eligible for interview. Of this number, about 3,000 occupied units were visited but interviews were not obtained because the occupants were not found at home after repeated calls or were unavailable for some other reason.

The following table provides a description of some aspects of the CPS sample designs in use during the referenced data collection periods.

Description of the Current Population Survey

Time period	Number of sample areas[1]	Housing units eligible	
		Interviewed	Not interviewed
1985	629/729[2]	57,500	3,000
1980	629	63,000	2,500
1975	461	45,000	2,000
1970	449	48,000	2,000

[1]Numbers do not include supplemental Spanish households.
[2]During the redesign, housing units from both designs were in the sample.

CPS estimation procedure. The estimation procedure used in this survey involved the inflation of the weighted sample results to independent estimates of the total civilian noninstitutional population of the United States by age, race, sex, and Hispanic/non-Hispanic categories. These independent estimates are based on statistics from the decennial censuses of population; statistics on births, deaths, immigration and emigration; and statistics on the strength of the Armed Forces. The estimation procedure for the data from the March supplement involved a further adjustment so that husband and wife of a household received the same weight.

RELIABILITY OF THE ESTIMATES

Since the CPS estimates were based on a sample, they may differ somewhat from the figures that would have been obtained if a complete census had been taken using the same questionnaires, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The accuracy of a survey result depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates. The standard errors provided for the CPS estimates primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in responses and enumeration, but do not measure any systematic biases in the data. (Bias is the difference, averaged over all possible samples, between the estimate and the desired value.)

Nonsampling variability. Nonsampling errors can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness on the part of respondents to provide correct information, inability to recall information, errors made in data collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units with the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall undercoverage as compared to the level of the 1980 Decennial Census is about 7 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races combined than for Whites. Ratio estimation to independent age-sex-race-Hispanic population controls, as described previously, partially corrects for the bias due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in missed households or missed persons in interviewed households have different characteristics from those of interviewed persons in the same age-sex-race-Hispanic group. Further, the independent population controls used have not been adjusted for undercoverage in the 1980 census.

For additional information on nonsampling error including the possible impact on CPS data when known, refer to Statistical Policy Working Paper 3, *An Error Profile: Employment as Measured by the Current Population Survey,* Office of Federal Statistical Policy and Standards, U.S. Department of Commerce, 1978 and Technical Paper 40, *The Current Population Survey: Design and Methodology,* Bureau of the Census, U.S. Department of Commerce.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the entire population was surveyed. The sample estimate and its standard error enable one to construct confidence intervals, ranges that would include the average results of all possible samples with a known probability. For example, if all possible samples were selected, each of these being surveyed under essentially the same general conditions and using the same sample design, and if an estimate and its standard error were calculated from each sample, then:

1. Approximately 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the average result of all possible samples.
2. Approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the average result of all possible samples.

The average estimate derived from all possible samples is or is not contained in any particular computed interval. However, for a particular sample, one can say with specified confidence that the average estimate derived from all possible samples is included in the confidence interval.

Standard errors may also be used to perform hypothesis testing, a procedure for distinguishing between population parameters using sample estimates. The most common type of hypothesis appearing in this report is that the population parameters are different. An example of this would be comparing the average size of households maintained by male householders versus those maintained by female householders. Tests may be performed at various levels of significance, where a level of significance is the probability of concluding that the characteristics are different when, in fact, they are identical.

To perform the most common test, let x and y be sample estimates for two characteristics of interest. Let the standard error on the difference x-y be σ_{DIFF}. If the ratio $R = (x-y)/\sigma_{DIFF}$ is between -2 and +2, no conclusion about the difference between the characteristics is justified at the 0.05 level of significance. If, on the other hand, this ratio is smaller than -2 or larger than +2, the observed difference is significant at the 0.05 level. In this event, it is commonly accepted practice to say that the characteristics are different. Of course, sometimes this conclusion will be wrong. When the characteristics are, in fact, the same, there is a 5 per cent chance of concluding that they are different. All statements of comparison in the text have passed a hypothesis test at the 0.10 level of significance or better, and most have passed a hypothesis test at the 0.05 level of significance or better. This means that, for most differences cited in the text, the estimated difference between characteristics is greater than twice the standard error of the difference. For the other differences mentioned, the estimated difference between characteristics is between 1.6 and 2.0 times the standard error of the difference. When this is the case, the statement of comparison is qualified, e.g., by the use of the phrase "some evidence."

Comparability of data. Data obtained from the CPS and other governmental sources are not entirely comparable. This is due in large part to differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources.

Caution should also be used when comparing estimates for 1980 and later, which reflect 1980 census-based population controls, with estimates from earlier years. This change in population controls had relatively little impact on summary measures such as means, medians, and percent distributions, but did have a significant impact on levels. For example, use of 1980-based population controls results in about a 2-percent increase in the civilian noninstitutional population and in the number of families and households. Thus, estimates of levels for 1980 and later will differ from those for earlier years by more than what could be attributed to actual changes in the population and these differences could be disproportionately

greater for certain subpopulation groups than for the total population.

In addition, the estimates in this report for 1985 are based on revised survey weighting procedures for persons of Spanish origin. In previous years the estimation procedures used in this survey involved the inflation of weighted sample results to independent estimates of the noninstitutional population by age, sex, and race. There was, therefore, no specific control of the survey estimates for the Spanish-origin population. During the last several years, the Bureau of the Census has developed independent population controls for the Spanish-origin population by sex and detailed age groups and has adopted revised weighting procedures to incorporate these new controls. It should be noted that the independent population estimates include some, but not all illegal immigrants.

Note when using small estimates. Summary measures (such as medians and percent distributions) are shown only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown, however, even though the relative standard errors of these numbers are larger than those for corresponding percentages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each data user's needs. Also, care must be taken in the interpretation of small differences. For instance, even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

Standard error tables and their use. In order to derive standard errors that would be applicable to a larger number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error.

The figures presented in tables B-1 and B-2 are approximations to the standard errors of estimated numbers and estimated percentages. To obtain the approximate standard error for a specific characteristic the appropriate standard error in tables B-1 or B-2 must be multiplied by the factor for that characteristic given in table B-3. These factors must be applied to the generalized standard errors in order to adjust for the combined effect of the sample design and the estimating procedure on the value of the characteristic.

Standard errors for intermediate values not shown in the generalized tables of standard errors may be approximated by linear interpolation. The factors for all household members should be used for characteristics pertaining to all persons in a household. For characteristics which include only some household members, such as "children under 18 years of age," the factor for some household members should be used.

Table B-1. Standard Errors of Estimated Numbers

(Numbers in thousands)

Size of estimate	Standard error[1]	Size of estimate	Standard error[1]
25	11	5,000	148
50	15	10,000	206
100	21	15,000	248
250	33	25,000	310
500	47	50,000	402
1,000	67	100,000	445
2,500	105		

[1]For a particular characteristic, see table B-3 for the appropriate factor to apply to the above standard errors.

Note: To estimate standard errors for the years 1970 and 1975, multiply the above standard errors by 0.88.

Two parameters (denoted "a" and "b') are used to calculate standard errors for each type of characteristic; they are presented in table B-4. These parameters were used to calculate the standard errors in tables B-1 and B-2 and to calculate the factors in table B-3. They also may be used directly to calculate the standard errors for estimated numbers and percentages. Methods for computation are given in the following sections.

Standard errors of estimated numbers. The approximate standard error, σ_x, of an estimated number shown in this report can be obtained in two ways. It may be obtained by use of the formula

$$\sigma_x = f\sigma \qquad (1)$$

Where f is the appropriate factor from table B-3 and σ is the standard error on the estimate obtained by interpolation from table B-1. Alternatively, the standard error may be approximated by formula (2) from which the standard errors in table B-1 were calculated. Use of this formula will provide more accurate results than the use of formula (1) above

$$\sigma_x = \sqrt{ax^2 + bx} \qquad (2)$$

Here x is the size of the estimate and a and b are the parameters in table B-4 associated with the particular characteristic.

Illustration of the computation of the standard error of an estimated number. Table A of this report shows that in 1985 there were 50,350,000 married-couple family households. Using formula (2) with a = -0.000010 and b = 1778 from table B-4, the approximate standard error [1] is

$$\sqrt{253{,}000 = (-0.000010)(50{,}350{,}000)^2 + (1778)(50{,}350{,}000)}$$

The 90-percent confidence interval for the number of married-couple family households is from 49,945,000 to 50,755,000

[1] Using formula (1), table B-1 and the appropriate factor from table B-3, the approximate standard error is 0.63 x 402,000 = 253,000.

Table B-2. Standard Errors of Estimated Percentages

Base of percentage (thousands)	Estimated percentage[1]					
	1 or 99	2 or 98	5 or 95	10 or 90	25 or 75	50
75	2.4	3.4	5.3	7.3	10.6	12.2
100	2.1	3.0	4.6	6.3	9.2	10.6
250	1.3	1.9	2.9	4.0	5.8	6.7
500	0.9	1.3	2.1	2.8	4.1	4.7
1,000	0.7	0.9	1.5	2.0	2.9	3.3
2,500	0.4	0.6	0.9	1.3	1.8	2.1
5,000	0.3	0.4	0.7	0.9	1.3	1.5
10,000	0.21	0.3	0.5	0.6	0.9	1.1
15,000	0.17	0.24	0.4	0.5	0.7	0.9
25,000	0.13	0.19	0.3	0.4	0.6	0.7
50,000	0.09	0.13	0.21	0.3	0.4	0.5
100,000	0.07	0.09	0.15	0.20	0.3	0.3

[1]For a particular characteristic, see table B-3 for the appropriate factor to apply to the above standard errors.

Note: To estimate standard errors for the years 1970 and 1975, multiply the above standard errors by 0.88.

(using 1.6 times the standard error). The 95-percent confidence interval is from 49,844,000 to 50,856,000 (using twice the standard error).

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends upon both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factors or parameters from table B-3 or B-4 indicated by the numerator. The approximate standard error, $\sigma(x,p)$, of an estimated percentage can be obtained by use of the formula:

$$\sigma_{(x,p)} = f\sigma \qquad (3)$$

In this formula, f is the appropriate factor from table B-3 and σ is the standard error on the estimate from table B-2. Alternatively, it may be approximated by the following formula from which the standard errors in table B-2 were calculated. Use of this formula will give more accurate results than use of formula (3) above.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x}\cdot p\,(100-p)} \qquad (4)$$

Here x is the size of the subclass of persons or households which is the base of the percentage, p is the percentage ($0 < p < 100$), and b is the parameter in table B-4 associated with the particular characteristic in the numerator of the percentage.

Illustration of the computation of the standard error of a percentage. Table A shows that of the 86,789,000 households in 1985, 27.7 percent were nonfamily households. Using formula (4) with b = 1778 from table B-4, the approximate standard error[2] on 27.7 is

$$0.2 \doteq \sqrt{\frac{1778}{86{,}789{,}000}\,(27.7)\,(72.3)}$$

Thus, the 90-percent confidence interval for the percentage of households that are nonfamily households in 1985 is from 27.4 to 30.0, and the 95-percent confidence interval is from 27.3 to 30.1.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \qquad (5)$$

where σ_x and σ_y are the standard errors of the estimates x and y, respectively. The estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas or for the difference between separate and uncorrelated characteristics in the same area. If, however, there is a high positive (negative) correlation between the two characteristics, the formula will overestimate (underestimate) the true standard error.

Illustration of the computation of the standard error of a difference. Table A shows that in 1985, 58.0 percent of all households (86,789,000) were maintained by married couples. Table A also shows that in 1975, 66.0 percent of all households (71,120,000) were maintained by married couples. Thus, the apparent difference between the percent of households maintained by married couples in 1985 and 1975

[2]Using formula (3), tables B-2 and B-3, the appropriate standard error is 0.63 x 0.3 = 0.2.

Table B-3. Factors to be Applied to Generalized Standard Errors in Tables B-1 and B-2

Characteristic	Persons						Families and unrelated individuals, households, or householders		
	Some household members and secondary individuals			All household members					
	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin	Total or White	Black	Spanish origin
Total or regional . . .	1.00	1.20	1.20	1.10	1.45	1.45	0.63	0.60	0.60
Education, tenure . .	(X)	(X)	(X)	(X)	(X)	(X)	0.63	0.60	0.60
Employment status and occupation . . .	(X)	(X)	(X)	(X)	(X)	(X)	0.67	0.67	0.53

(X) Not applicable.

is 8.0 percent. Using formula (4) and the appropriate b parameters from table B-4, the approximate standard error, σ_y, of 58.0 percent with a base of 86,789,000 is 0.2 percent. The standard error, σ_y, of 66.0 percent with a base of 71,120,000 is also 0.2 percent. Using formula (5), the standard error of the estimated difference of 8.0 percent is about

$$\sqrt{(0.2)^2 + (0.2)^2} = 0.3 \text{ percent}$$

This means that the 90-percent confidence interval on the difference between the households maintained by married couples in 1985 and 1975 is from 7.5 to 8.5 percent. The 95-percent confidence interval on the difference of 8.0 percent is from 7.4 to 8.6 percent. Therefore, a conclusion that the average estimate derived from all possible samples lies within a range computed in this way would be correct for roughly 95 percent of all possible samples. Since this interval does not contain zero, we can conclude with 95-percent confidence that the percent of households maintained by married couples in 1985 decreased from 1975.

Standard error of a ratio. Certain mean values for persons in families or households shown in tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family or household is calculated as

$$\frac{x}{y} = \frac{\text{total number of persons in families or households}}{\text{total number of families or households}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families or households of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families or households.

Case 1: There is at least one person having the characteristic in every family or household of the class: as an example, the mean number of persons per family or the mean number of persons per family with a male householder. For ratios of this kind, the standard errors are approximated by the following formula:

$$\sigma_{x/y} = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho\left(\frac{\sigma_x}{x}\right)\left(\frac{\sigma_y}{y}\right)\right]} \quad (6)$$

Table B-4. "a" and "b" Parameters for Estimated Numbers and Percentages of Persons, Families and Unrelated Individuals, Households, or Householders

Characteristic	Persons		Families and unrelated individuals, households, or householders	
	a	b	a	b
Total or regional:				
Total or White	(X)	(X)	-0.000010	1778
Some household members	-0.000025	4480	(X)	(X)
All household members	-0.000031	5444	(X)	(X)
Black and other races	(X)	(X)	-0.000066	1606
Some household members	-0.000265	6426	(X)	(X)
All household members	-0.000391	9475	(X)	(X)
Spanish origin	(X)	(X)	-0.000137	1606
Some household members	-0.000548	6426	(X)	(X)
All household members	-0.000807	9475	(X)	(X)
Education and tenure:				
Total or White	(X)	(X)	-0.000010	1778
Black and other races	(X)	(X)	-0.000066	1606
Spanish origin	(X)	(X)	-0.000137	1606
Employment status and occupation:				
Total or White	(X)	(X)	-0.000025	2013
Black and other races	(X)	(X)	-0.000243	2013
Spanish origin	(X)	(X)	-0.000222	1241

(X) Not applicable.

Note: For years 1970 and 1975, a standard error estimate computed with the "a" and "b" parameters or with the "f" factor must be adjusted. Multiply the standard error by 0.88.

The standard error of the estimated number of households, σ_y, and the standard error of the estimated number of persons with the characteristic in those households, σ_x, may be obtained from formula (1). Alternatively, formula (2) and table B-4 may be used. In formula (6), ϱ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above example, and for other ratios of this kind, use 0.7 as an estimate of ϱ.

Case 2: The number of persons having the characteristic in a given household may be 0, 1, 2, 3, or more; an example would be the mean number of persons under 18 years of age per household. For ratios of this kind the standard error is approximated by formula (6) but ϱ is assumed to be zero. If ϱ is actually positive (negative), then this procedure will provide an overestimate (underestimate) of the standard error of the ratio.

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of an estimated median is to determine a confidence interval about it. (See the section on sampling variability for a general discussion of confidence intervals.) The following procedure may be used to estimate the 68-percent confidence limits of a median based on sample data.

1. Determine, using the standard error tables and factors or formula (4), the standard error of the estimate of 50 percent from the distribution.

2. Add to and subtract from 50 percent the standard error determined in step (1).

3. Using the distribution of the characteristic, calculate the 68-percent confidence interval by calculating the values corresponding to the two points established in step (2). The values will be the limits for the confidence interval. Use the formula below and the tabulated cumulative distribution of the characteristic to interpolate between values.

$$X = \frac{pY - A_1}{A_2 - A_1} \times (T_2 - T_1) + T_1$$

where X = the interpolated estimate of the upper or lower limit;

p = the upper or lower limit obtained from step (2);

Y = the base of the distribution

A_1 and A_2 = the lower and upper values of the cumulative frequency for the limits of the interval which contains pY; and

T_1 and T_2 = the lower and upper values of the characteristic in the interval which contains pY.

4. The standard error of the median can be approximated by the formula:

$$\sigma_{median} = \frac{X_U - X_L}{2}$$

where X_U = upper limit of the 68-percent confidence interval and;

X_L = lower limit of the 68-percent confidence interval.

Illustration of the computation of a confidence interval for a median. Table C of this report shows that in 1985 the median age of all householders was 45.4 years. Table C also indicates the base of the distribution from which this median was determined was 86,789,000 households.

1. Using formula (4) and the appropriate b parameter from table B-4, the standard error of 50 percent on a base of 86,789,000 is

$$\sqrt{\frac{1778}{86{,}789{,}000}} (50)(50) \doteq 0.2 \text{ percent}$$

2. To obtain a 68-percent confidence interval on an estimated median, add to and subtract from 50 percent the standard error found in step (1). This yields percent limits of 49.8 and 50.2.

3. From table C, 42,933,000 (49.5 percent) of all householders were under 45 years of age and 55,561,000 (64.0 percent) were under 55.

Thus, the entire 68-percent confidence interval falls in the age interval from 45 to 54 years. The upper limit of the confidence interval is calculated, using linear interpolation, to be about

$$\frac{(.502)(86{,}789{,}000) - 42{,}933{,}000}{55{,}561{,}000 - 42{,}933{,}000} \times (55-45) + 45 \doteq 45.5.$$

Similarly, the lower limit is calculated to be about

$$\frac{(.498)(86{,}789{,}000) - 42{,}933{,}000}{55{,}561{,}000 - 42{,}933{,}000} \times (55-45) + 45 \doteq 45.2.$$

Thus, an approximate 68-percent confidence interval for the median age of all householders is from 45.2 to 45.5 years.

4. The standard error of the median is, therefore

$$\frac{45.5 - 45.2}{2} \doteq 0.15$$

Similarly, the 95-percent confidence interval on the median age of all householders is found to be from 45.1 to 45.6.
